

**Tokenization created assets. GlemO
builds distribution. Liquidity starts
with demand.**

INVESTMENT THESIS

Tokenized assets need distribution. GlemO builds the neutral rail.

GlemO connects banks, originators, tokenizers and investors through an AI-native liquidity and distribution layer. Real estate is the first proof market, not the final category.

Proof

Platform

Expansion

Investor read: underwrite a staged infrastructure company, not a single asset or single partner story.

The market gap sits between tokenization and demand.

Originators and tokenizers can create assets. GlemO focuses on demand, onboarding, analytics and controlled distribution.

Liquidity, demand data and distribution feedback flow back to originators and assets.

FIRST PROOF MARKET

First pilots prove the rail. The platform is asset-class neutral.

Real estate is an initial proof market. GlemO uses existing operating proof to validate a broader rail for tokenized assets.

Bankable asset base

A bankable RWA category where better distribution and liquidity can create institutional value.

Illiquidity problem

Assets are long-duration and difficult to distribute digitally without trusted rails.

Operating proof

GlemO already has AI workflow, asset demand, partners and transaction knowledge.

Expansion logic

The same discovery, compliance and reporting rails can support multiple tokenized asset categories.

Why this layer matters now

01 Institutional balance-sheet pressure

Financial institutions need better tools to structure, monitor and distribute real-world-asset exposure.

02 AI-native distribution

AI reduces the cost of matching, education, follow-up, demand capture and partner operations.

03 Tokenization infrastructure maturity

Wallets, KYC, custody, reporting and smart-contract tooling are ready for controlled pilots.

04 Qualified demand activation

Qualified channels create acquisition, feedback and demand signals for asset discovery.

BUSINESS MODEL

Revenue starts before transaction scale.

The first revenue wedge is paid infrastructure for institutions and sellers. Transaction fees, dApps and token incentives expand after the rail proves usage.

Operating proof

Validates workflows, partners and demand before Web3 scale.

Institutional fees

Banks and financial institutions pay setup, integration, monitoring and platform fees.

Transaction fees

GlemO can earn fees when approved buyers transact through the platform.

Ecosystem extensions

Internal modules and approved builders can add utility after platform controls are live.

Token layer

Supports developer incentives and verified contribution after legal, governance and liquidity gates.

The investment case starts with neutral rail revenue. Token and dApps support expansion after the platform proves demand.

PROOF TODAY

GlemO has operating proof.

Current Brazilian Web2 operation supports the infrastructure story: AI demand, partner relationships and cross-border operating learning.

30K

AI interactions/day

US\$6M+

GMV intermediated

~100

active partners

8

AI apps in production

US\$1M+

founder capital invested

4

countries with activity

Note: these metrics come from the existing Brazilian Web2 operation. GMV is transaction volume, not net revenue.

PRODUCT ARCHITECTURE

The platform turns fragmented RWA work into one workflow.

GlemO connects onboarding, asset discovery, reporting and buyer activation in one controlled operating layer.

Onboarding

KYC, geofencing and investor profiles

GlemO Platform

AI-native liquidity and distribution layer

Reporting

Monitoring, analytics and institution-facing dashboards

Contract-pool discovery

Asset presentation, suitability and demand mapping

Buyer activation

Qualified access, education and demand signals

ECOSYSTEM EXTENSIONS

dApps and community expand the ecosystem after the core rail works.

Internal modules and external builders can add workflow utility after the marketplace, data layer and compliance controls are live.

YEAR 1 PROOF MODEL

Year 1 is about evidence, not vanity scale.

The first year should prove that users, sellers and institutions repeat the behavior the platform needs to scale.

2 institutional partners

Setup, monitoring and platform fees validate institutional workflows.

5k users

Qualified users validate discovery, education and buyer response.

20 approved modules

Ten paid tests per module at US\$50/month validate demand for ecosystem extensions.

50 routed opportunities

Tracked from lead to review, allocation request and settlement where approved.

Seed proof target: repeatable demand, regulated partner value, platform usage and credible revenue quality.

ROADMAP

Roadmap turns spend into seed proof.

Every milestone should create evidence investors can underwrite.

0-6 months Foundation

MVP1 platform, wallet/reporting
policy and legal perimeter

Platform ownership

6-12 months Usage proof

2 institutions, qualified buyers
and first paid workflows

Demand + rails

12-18 months Scale evidence

Asset supply, distribution
analytics and partner
dashboards

Repeatable adoption

18-24 months Seed readiness

Evidence pack, compliance
docs, revenue proof, scalable
team

Investability

USE OF FUNDS

The US\$2M round buys the evidence for seed.

Each budget bucket ties to platform ownership, demand proof, legal readiness and operating discipline.

US\$650K	Technology / platform	Rail, marketplace front, onboarding, reporting, provider routing and security.	Product proof
US\$408K	Team + operations	Founder draw plus admin/project operations over 24 months.	Execution backbone
US\$395K	Legal, token + infra	Counsel, token governance, KYC/KYB, cloud, data, CRM and Web3 tooling.	Controlled perimeter
US\$350K	Liquidity + market hub	MM readiness plus qualified supply, provider and buyer development.	Distribution proof
US\$197K	Events + reserve	Curated strategic events and protected contingency.	Cash discipline

Token value should follow platform utility.

Token design should support useful dApps, AI agents, developer tooling and verified contribution, subject to legal, market and liquidity readiness.

Developer incentives

Reward teams building useful modules around RWA workflows.

Community activation

Support verified education, discovery and feedback contributions.

Governance path

Move toward platform governance only after operational maturity.

No asset-yield claim

Token mechanics must remain separate from direct RWA cash-flow promises.

From neutral rail to tokenized private-market infrastructure.

The first 24 months should turn controlled asset pilots into reusable infrastructure for banks, providers, buyers and builders.

1. Prove the rail

Signed institutions, qualified buyers, operating discipline and first routed-asset proof.

2. Open the platform

APIs, dashboards and extensions turn banks, fintechs, providers and users into platform participants.

3. Compound the network

Token incentives, developer apps and shared distribution grow together.

The team must reduce execution risk.

The revised story strengthens technical credibility with institutional digital-asset experience.

Gleisson Herit

Founder & CEO

30 years in digital projects; 1,000+ companies served; architect of a major digital real-estate case in Brazil; US\$1M+ personally invested since 2021.

Bruno Grossi

Advisor and Director of Innovation at Inter Bank

Supports banking workflow design, platform architecture and digital-asset readiness. Employer listed for context, not institutional endorsement.

Operating bench

11 digital specialists plus planned senior hires and advisory board across PropTech, cross-border, regulatory and Web3 execution.

RISK CONTROLS

The data room is designed to remove committee friction.

The package separates current proof, gated work, future optionality and legal controls.

Token confusion	GO supports ecosystem incentives. It does not represent direct RWA yield.
Institution dependency	GlemO routes through multiple banks, regulated partners and providers.
Execution burden	A focused build team and Bruno Grossi's advisor role support banking workflow design.
Revenue complexity	Separate institution fees, transaction fees and workflow/SaaS revenue from token incentives.
Valuation stretch	Large valuation is a future infrastructure case, not today's proof-round price.

THE ASK

Own the liquidity layer before RWA distribution becomes obvious.

GlemO starts with bankable asset pilots and expands toward the distribution infrastructure tokenized private markets will need.

Raise

US\$2M proof round
SAFE + token warrant

Use

Technology, team, legal/compliance,
liquidity readiness, market hub and
reserve

Next milestone

24-month proof path toward
credible seed readiness
